
DARK NIGHT

DEVELOPMENT ENVIRONMENT MANUAL

Packages required:

Python 2.7 (64-bit)
Pyglet (latest version)
AVbin 11 alpha 4
OpenAL (latest version)

Note that AVbin has problems with most applications in its stable release, which is the reason why we recommend this version of AVbin.

To set-up the development environment to contribute in developing this application, please install Python 2.7. We still do not support Python 3 as of this moment, but some changes to the source code can make it possible to port this game source to a Python 3 environment.

Pyglet is also required to run the code. Information on installing Pyglet with Python 2.7 is provided in pyglet.org.

To package the game to an executable, please use pyinstaller. The pyinstaller package can be installed to Python by running:

```
pip install pyinstaller
```
